Let use \( j, i, k, q, p \) as the indexes for the five layers from left to right, and thus we have
\[
j = 1, 2, \ldots, s_{n_l-4}, \quad i = 1, 2, \ldots, s_{n_l-3}, \quad k = 1, 2, \ldots, s_{n_l-2}, \quad q = 1, 2, \ldots, s_{n_l-1} \text{ and } p = 1, 2, \ldots, s_{n_l}.
\]

As an example, we will derive the \( \frac{\partial J}{\partial W_{i \leftarrow j}} \), i.e. the gradient of cost function with respect to the weight \( W_{i \leftarrow j} \). Although we use this particular example to show the derivation, it can be easily generalized to the generic form of the gradient with respect to any weight other of the network. The gradients with respect to the biases can also be derived straightforwardly as discussed later. Also note that in the derivation of the gradients, the layers are indexed using the numbers on the bottom line of the figure.

\[
\frac{\partial J}{\partial W_{i \leftarrow j}} = \frac{1}{2} \sum_{p=1}^{s_{n_l}} \left( y_p - h_p(W, b; x) \right)^2 \\
= - \sum_{p=1}^{s_{n_l}} \left( y_p - h_p(W, b; x) \right) \cdot \frac{\partial h_p(W, b; x)}{\partial W_{i \leftarrow j}}
\]

Figure 1 Part of a neural network used to illustrate the gradient of the output with respect to the weight \( W_{i \leftarrow j}^{(l)} \)
Title: Derivation of the back-propagation algorithm

Let us first look into the right-hand side part of each term in the above sum.

\[
\begin{align*}
\frac{\partial h_p(W, b; x)}{\partial W^{(n-4)}_{l=j}} &= \frac{\partial a_p^{(n)}}{\partial W^{(n-4)}_{l=j}} = \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \frac{\partial z_p^{(n)}}{\partial W^{(n-4)}_{l=j}} = \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \frac{\partial W^{(n-1)}_p \cdot a^{(n-1)}}{\partial W^{(n-4)}_{l=j}} \\
&= \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}} = \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}} \\
&= \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \left[ \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}} \right] \\
&= \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}} \\
&= \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}} \\
&= \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}} \\
&= \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}} \\
&= \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}} \\
&= \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}} \\
&= \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}} \\
&= \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}} \\
&= \frac{d a_p^{(n)}}{d z_p^{(n)}} \cdot \sum_{q=1}^{s_{n-1}} W^{(n-1)}_{p=q} \cdot \frac{\partial a_q^{(n-1)}}{\partial W^{(n-4)}_{l=j}}
\end{align*}
\]
Figure 2 On each layer, the error is propagated to every unit there, but only one of them is shown using a coloured path.

The trick comes into play in this step...

\[
\begin{align*}
\frac{da_p^{(n_1)}}{dz_p^{(n_1)}} &= \sum_{q=1}^{s_{n_1-1}} W_p^{(n_1-1)} \cdot \frac{da_q^{(n_1-1)}}{dz_q^{(n_1-1)}} \cdot \left( \sum_{k=1}^{s_{n_1-2}} W_q^{(n_1-2)} \cdot \frac{da_k^{(n_1-2)}}{dz_k^{(n_1-2)}} \cdot W_k^{(n_1-3)} \right) \\
&= \sum_{q=1}^{s_{n_1-1}} \sum_{k=1}^{s_{n_1-2}} \frac{da_p^{(n_1)}}{dz_p^{(n_1)}} \cdot W_p^{(n_1-1)} \cdot \frac{da_q^{(n_1-1)}}{dz_q^{(n_1-1)}} \cdot W_q^{(n_1-2)} \cdot \frac{da_k^{(n_1-2)}}{dz_k^{(n_1-2)}} \cdot W_k^{(n_1-3)} \\
&= \left( \sum_{q=1}^{s_{n_1-1}} \sum_{k=1}^{s_{n_1-2}} \frac{da_p^{(n_1)}}{dz_p^{(n_1)}} \cdot W_p^{(n_1-1)} \cdot \frac{da_q^{(n_1-1)}}{dz_q^{(n_1-1)}} \cdot W_q^{(n_1-2)} \cdot \frac{da_k^{(n_1-2)}}{dz_k^{(n_1-2)}} \cdot W_k^{(n_1-3)} \right) \cdot \frac{da_k^{(n_1-3)}}{dz_k^{(n_1-3)}} \cdot a_j^{(n_1-4)}
\end{align*}
\]
The error propagated to each of them (or in other words the error contributed by each of them) can be computed via a backward pass.

Now if we bring back the sum over the units in the output layer, the above result will become

$$\frac{\partial J(W, b; x, y)}{\partial W_i^{(l)}} = \left( \frac{d a_i^{(n_l-3)}}{d z_i^{(n_l-3)}} \right) \sum_{k=1}^{s_{n_l-2}} W_k^{(n_l-3)} \left( \frac{d a_k^{(n_l-2)}}{d z_k^{(n_l-2)}} \right) \sum_{q=1}^{s_{n_l-1}} W_q^{(n_l-2)} \left( \frac{d a_q^{(n_l-1)}}{d z_q^{(n_l-1)}} \right) \sum_{p=1}^{s_{n_l}} W_p^{(n_l-2)} \left( \frac{d a_p^{(n_l)}}{d z_p^{(n_l)}} \right) \delta_p^{(n_l-1)}.$$ 

The above steps indicates the notion of propagating the error from the output unit to the weight of interest.

Assuming the activations of all the units on all the layers have been computed through a forward pass. The error propagated to each of them (or in other words the error contributed by each of them) can be computed via a backward pass.

1) The error at the output unit $p$ is calculated by

$$\delta_p^{(n_l)} = - \left( y - h_p(W, b; x, y) \right) \frac{dh_p(W, b; x, y)}{dz_p^{(n_l)}} = - \left( y - h_p(W, b; x, y) \right) \frac{d a_p^{(n_l)}}{d z_p^{(n_l)}}.$$
2) The error propagated to each of the units of the network from the output layer until the first hidden layer can be computed by

$$
\delta_k^{(l)} = \left( \sum_{q=1}^{s_l+1} W_{q \rightarrow k}^{(l)} \cdot \delta_q^{(l+1)} \right) \cdot \frac{da_k^{(l)}}{dz_k^{(l)}}
$$

where we kind of abuse the notation of $k$ and $q$ because they used to be the indexes of the units on the layer $n_l - 1$ and $n_l - 2$. In the above equation, they are the indexes of the units on any two adjacent layers.

3) The gradient of the cost function with respect to a certain weight, say $W_{i \rightarrow j}^{(l)}$, can be computed by

$$
\frac{\partial h_p(W, b; x, y)}{\partial W_{i \rightarrow j}^{(l)}} = \delta_{i}^{(l+1)} \cdot a_j^{(l)}
$$

The gradient of the cost function with respect to a certain bias can be derived in the same way.
